

HACKATHON CHALLENGE BRIEF

Ontario All-Quote Agent Challenge

One intake. Every reachable rate. Evidence for every result.

Build an agentic tool that obtains and compares Ontario private-passenger auto insurance quotes across direct, agent, broker, aggregator, affinity, specialty, MGA/program and residual-market channels.

KICKOFF

Sunday, August 9, 2026 | 9:00 AM to 5:00 PM ET

SUBMISSION DEADLINE

Wednesday, August 12, 2026 | 11:59 PM ET

Individual participation | Ontario residents only | In-person or remote participation

1. The challenge

PERSONAL-USE CHALLENGE Build YOUR OWN personal assistant to get and compare YOUR OWN Ontario auto-insurance rates. It must work only for the participant's own insurance-shopping needs and must not obtain quotes, make calls or submit information for anyone else.

BEFORE YOU START Enter individually, be an Ontario resident and build only for your own insurance-shopping needs. Use only your own information for live interactions. If you do not drive or do not have a licence, you can still compete using the permitted estimate-only or discovery route described below. You are responsible for your own tools and costs unless the Organizer announces otherwise.

MISSION Take the participant's own accurate profile and attempt to obtain a comparable quote from every distinct Ontario private-passenger auto rate source available to that participant.

The finished product should feel like a capable insurance-shopping operator for its own developer. It collects the participant's data once, plans the right route for each market, completes available web, phone, broker or other permitted journeys, normalizes the results, and explains what it could not obtain.

This is not a model-training exercise and it is not a bulk-scraping contest. The hard parts are market discovery, workflow orchestration, reliable computer use, truthful voice interaction, data normalization, privacy and honest accounting of coverage. The rate is not the prize; a working, evidence-backed retrieval flow is.

What success looks like

- One intake: the applicant enters each material fact once.
- Broad reach: direct writers, exclusive agents, broker panels, affinity programs, specialty programs, mutuals and the residual market are all considered.
- Open-ended execution: use whatever permitted combination of tools, automation and human handoffs best reaches the market without prescribing one SDK, browser framework or interface.
- Comparable output: premiums are shown only beside matching coverage assumptions, with differences called out.
- Proof, not claims: every market ends in a quote or an evidence-backed terminal status.
- Safe by design: no fabricated licence numbers, no hidden automation, no binding a policy and no sensitive data in logs or repositories.

What “every” means

“Every” means every distinct, current rate source that the applicant can lawfully and truthfully access for the stated risk. A consumer brand, legal underwriting company, insurer group and broker panel may describe the same underlying rate source. Conversely, one insurer group may expose different programs through direct, affinity and broker channels. Your system must discover and deduplicate those relationships.

Participant profile and eligibility

- You must be an Ontario resident when you register, participate and submit. Ontario residence, not citizenship, is the relevant eligibility requirement.
- In-person attendance on August 9 is encouraged but not required. Ontario residents may participate remotely and remain eligible if they meet the submission requirements and deadline.
- Entries are individual only. Teams, shared repositories, joint submissions and pooled work are not permitted unless the Organizer gives prior written approval.
- This is the participant's personal assistant for the participant's own rates. It is not a service for friends, family, customers or the public.
- Use the participant's own accurate information for any live quote or interaction with a real insurer, agent or broker. A shared canned driver profile is deliberately not provided and the quoted rate itself is not being judged.
- You do not need to drive or hold an Ontario driver's licence to compete or win. This is okay because judging rewards safe market discovery, routing, evidence, clear handoffs and normalized results, not a completed rate. A participant without a licence may demonstrate discovery or an estimate-only workflow using a clearly labelled hypothetical profile only in a local sandbox or a destination flow that expressly permits non-binding estimates based on assumptions.
- A hypothetical profile must never contain a driver's licence number, enter a verification, consent, declaration, callback or purchase step, or be represented to a real person as a real applicant. The system must label that outcome `estimate_only`, `manual_handoff` or `blocked` as appropriate.

Coverage and guardrails

COVERAGE RULE A complete attempt does not require a price from an unavailable market. It does require evidence. Accepted terminal statuses include quoted, estimate only, callback required, manual handoff, ineligible, affinity restricted, specialty only, duplicate rate source, not currently writing, access blocked by terms or CAPTCHA, unreachable after a bounded attempt, and unresolved.

Out of scope

- Purchasing, binding, renewing, cancelling or modifying an insurance policy.
- Submitting payment information, an electronic signature or an application declaration.
- Bypassing CAPTCHAs, bot controls, authentication, rate limits or other access controls.
- Using another person's identity, licence number, address, vehicle, claims history or consent, or presenting hypothetical information as a real applicant's information.
- Changing material facts across insurers to manufacture a lower premium.
- Presenting an estimate, lead form or callback promise as a firm quote.

2. Required system behaviour

Recommended orchestration flow:

Consent-aware intake → market registry → route planner → browser and voice agents →
evidence store → quote normalizer → coverage ledger and comparison

Tooling freedom

Browser automation is an example, not a requirement. Choose any permitted technical approach that produces a trustworthy result: computer use, browser automation, approved APIs or integrations, voice, structured data capture, a licensed intermediary, a human-in-the-loop workflow or another creative design. There is no prescribed SDK, model, browser framework, dashboard or visible cursor interaction. Participants supply their own accounts, tools, API access and credits. The Organizer does not reimburse those costs unless it announces a specific reimbursement or discount in writing.

Freedom of approach does not authorize access-control evasion. Do not bypass CAPTCHAs, bot controls, authentication, rate limits or destination terms, and do not use private endpoints or credentials without the owner's authorization.

Web and computer-use routes

- Navigate official direct-writer sites and approved broker or aggregator quote journeys.

- Map each question to the canonical intake schema and ask the user only when a genuinely new field appears.
- Pause before any identity lookup, consent attestation, signature, payment or purchase action.
- Capture the source URL, timestamp, quote or reference ID, premium, coverage, discounts, validity period and a redacted evidence artifact.
- Stop at CAPTCHAs or explicit anti-automation barriers and record the status. Do not evade them.

Voice agents

Use voice when a website will not return a rate, routes the user to a sales line, promises a callback, or when a broker must reach a market manually. The implementation may place outbound calls and receive inbound callbacks.

Where a web journey yields a quote or reference ID before a call, preserve that ID, source URL, partial progress and consent state. Hand the context to the caller so the representative can continue the same journey; record whether the handoff returned a rate, an eligibility answer or an exact blocker.

Suggested outbound opening

Hello, I am an automated assistant acting for [applicant's legal name] to request an Ontario private-passenger auto insurance quote. Is it okay to continue with an automated assistant? The applicant is available if you need verification or consent.

Suggested inbound opening

Thank you for calling back. I am an automated assistant receiving this call for [applicant's legal name]. May I continue, or would you prefer to speak directly with the applicant?

- Disclose that the agent is automated and identify the purpose at the beginning of every call.
- Do not misrepresent the caller as a licensed broker, agent, insurer employee or human applicant.
- Do not claim affiliation with the organizer, an insurer or a brokerage. Do not volunteer irrelevant event details, but if asked about the prototype or its operator, answer truthfully and offer to transfer to the participant.
- Do not record or transcribe unless the other party affirmatively agrees. If consent is refused, retain only structured, non-audio outcome notes.
- Never spoof caller ID, pressure a representative, place repeated calls or continue after a request to stop.
- Escalate immediately when the representative requires the applicant, licensed advice, a declaration, identity verification or consent to obtain third-party records.

Human checkpoints

Checkpoint	Required behaviour
Identity or database lookup	Applicant confirms the legal name, licence use and consent immediately before submission.
Application declaration	Stop. Do not click or sign as part of the challenge.
Coverage advice	Present options and differences. Do not recommend suitability unless handled by a licensed professional.
CAPTCHA or access restriction	Hand off only if permitted; otherwise log the blocker.
Quote-to-purchase transition	Stop after saving the quote details. Do not bind.

3. Build the Ontario market map

The public auto-rate approval dataset returned 60 legal insurer records across 32 insurer groups on August 6, 2026. Use that dataset as the regulatory seed, not as a claim that all 60 entities are currently open for standard retail new business. It includes recent retail writers, specialty and commercial names, legacy entities and multiple legal companies within the same group. [1]

Keep these layers separate

Layer	Meaning for the project
Legal underwriter	The licensed company named on the policy or rate filing.
Insurer group	The parent or operating group that may contain several legal underwriters.
Consumer brand	The name the applicant sees. It may be a direct brand, affinity brand or broker brand.
Distributor	A direct writer, exclusive agent, independent broker or digital brokerage that can place the business.
Aggregator	A comparison or lead platform. Its output is only as broad as its live panel and the applicant's eligibility.
MGA or program	An administrator or wholesale market with delegated authority. It is not automatically a distinct insurer or standard auto market.
Residual market	A market of last resort accessed through a licensed broker or agent, not a normal direct quote path.

Required market-registry fields

- registry_id and last_verified_at
- legal_underwriter and insurer_group
- brand or program_name

- `distribution_type`: direct, exclusive agent, broker, aggregator, affinity, MGA/program, mutual or residual
- `product_scope`: standard PPA, non-standard PPA, high-net-worth, collector, affinity, commercial/specialty or unknown
- `quote_url`, public sales number and callback route
- `known_panel_source` and licensed intermediary
- `requires_licence`, `requires_VIN`, `requires_membership` and `requires_human`
- `terms_or_automation_notes`
- `status`, `evidence_url` or redacted artifact, and source citation
- `distinct_rate_source_id` for deduplication

A practical route strategy

Route	Action	Why it matters
Direct and exclusive-agent set	Attempt Allstate, Aviva Direct, belairdirect, CAA, Co-operators, Desjardins, RBC Insurance, Sonnet, Square One, TD Insurance and The Personal where the applicant qualifies.	Captures rates that broker panels may not expose. CADRI identifies eight major direct-relationship members; CAA and Square One add current public quote routes. [3] [7] [8]
Broad broker engine A	Use either Rates.ca or LowestRates.ca first, then inspect the returned legal underwriters.	LowestRates currently names CAA, Coachman, Economical, Gore, Pafco, Pembridge, SGI, Travelers and Zenith for auto quotes. Rates.ca describes insurer API and industry-rater connectivity. [9] [10]
Broad broker engine B	Use Surex to add or verify Aviva, Intact, Jevco, Wawanesa, CAA, Coachman, Definity/Economical, Gore, Pafco, Pembridge, SGI and Travelers, subject to the live panel and profile.	Its compensation disclosure is more useful than logo counts because it names insurer and MGA relationships. [11]
Independent broker verifier	Use a broad licensed brokerage such as ThinkInsure, Onlia or Scoop, or another RIBO-licensed broker, and request the complete carrier list and all quote outcomes.	Ontario law requires a broker to provide the names of its automobile insurer contracts and quote information obtained for the applicant. [6]
Gap-fill routes	Contact Ontario mutuals, affinity programs, high-net-worth markets, collector programs and the residual market through their actual route.	These are often absent, restricted or collapsed in mainstream aggregator output. [12] [13]

Panel membership changes. Participants must verify each route during the hackathon and record the date, source and returned underwriter. A claim such as “50+ providers” does not prove that 50 Ontario PPA quotes were produced for one profile.

4. Channel coverage requirements

Direct, affinity and digital routes

Route	Primary journey	Known underwriting layer
Allstate	Online quote plus agent path	Allstate Insurance Company of Canada

Starting map only. The implementation must capture the legal underwriter actually returned on the quote or disclosure page. [3] [7] [8] [14] [15] [16] [17] [18]

Broker, aggregator and branded-broker routes

Route	How to use it
Rates.ca / LowestRates.ca	Broad online comparison. Treat as overlapping routes until the returned panels prove otherwise.
Surex	Broad licensed brokerage and callback route; useful published carrier and MGA disclosure.
ThinkInsure	Broad independent brokerage, web intake and advisor completion.
Onlia	Digital brokerage with multiple carriers; capture the actual returned insurer, not the brokerage brand.
Scoop	Digital brokerage and callback workflow; confirm full panel.
PC Insurance	Branded digital brokerage; capture the returned underwriter and any eligibility discount.
Inova	Membership-based brokerage route; verify membership and actual panel.
InsuranceHotline	Lead and broker-network route, not itself the underwriting company.
Local independent broker	Essential for full market disclosure, mutuals, non-standard, specialty and residual-market access.

MGA, program and specialty discovery

Do not assume that every MGA produces a separate standard auto rate. Start with Hagerty for collector vehicles, where the program is administered separately and underwritten by Aviva. Treat Agile, APRIL Canada, Burns & Wilcox, Cambrian Special Risks, Milnco and Special Risk as discovery leads from broker disclosures. Count one only after verifying that it accepts an individual Ontario private-passenger risk relevant to the profile. [11] [13]

- Non-standard auto: test Echelon, Jevco, Pafco and Coachman through licensed broker routes when the profile fits.
- High-net-worth or specialty: verify Chubb and PURE through an appointed broker, and avoid counting a market that the user cannot access.
- Collector vehicles: route to Hagerty only if the vehicle and household meet program rules; it is not a daily-driver substitute.
- Residual market: Facility Association is the fallback for otherwise hard-to-place risks and is accessed through a licensed intermediary.
- Mutuals: use the Ontario Mutuals locator and validate product availability and territory with the specific mutual.

5. Canonical intake schema

The OAF 1 is the authoritative backbone for the information required to complete an Ontario auto insurance application. The quote agent should collect a superset of those fields, while applying data minimization and asking only what is necessary for the selected route. [2]

Applicant, contact and household

Data group	Fields and rules
Consent and mode	Consent timestamp; live-quote or discovery mode; permitted channels; approved insurers or brokers; callback permission; recording or transcription choice.
Identity	Alias for permitted discovery-only use; legal name for a live quote; preferred language; date of birth; gender field as required by the form; marital status.
Contact	Email, mobile, home or work phone, preferred callback window.
Primary address	Street, unit, city, province, postal code, residence start date, prior address if a route requires it, and confirmation that this is the normal residence and garaging location.
Household	All licensed household members, all regular vehicle users, dependants relevant to optional benefits, and other vehicles in the household.

Driver information

Data group	Fields and rules
Licence identity	Name exactly as shown on the licence; own valid Ontario driver's licence number when required; province; class; status; expiry if requested.
Licensing timeline	Dates or years for G1, G2 and G; date first licensed in Canada or the U.S.; other classes; recognized out-of-country experience and proof availability.
Training	Approved driver-training completion and certificate availability.
Assignment	Principal, secondary or occasional driver; percentage use by vehicle; other regular access.
Discount eligibility	Retiree criteria, student status, good-driver or group discounts, and willingness to consider telematics. Keep telematics quotes separate unless the user opts in.
Other drivers	All other licensed persons in the household or business and whether they have their own policy or require an exclusion form.

Vehicle and use

Data group	Fields and rules
Vehicle identity	VIN; model year; make; model; trim or body type; engine or fuel type; cylinders or engine size and GVWR where requested.
Ownership	Owned or leased; new or used; purchase or lease month and year; purchase price; registered owner; actual owner; lienholder or lessor details.

Data group	Fields and rules
Use	Pleasure, commute, school, business, farm or commercial; one-way commute distance; annual kilometres; business-use percentage; days commuting; carpool and passenger count.
Risk details	Garaging address; unrepaired damage; modifications or customization; non-factory equipment; winter tires; approved theft-recovery device; anti-theft features.
Special use	Rideshare, delivery, carshare, rental to others, passengers for compensation, trailer use, explosives or radioactive materials. These answers may trigger commercial or specialty handling.
Household fleet	Total household or business vehicles and driver-to-vehicle allocation.

6. History, coverage and quote controls

Insurance and driving history

History group	Fields and lookback
Current insurance	Insurer, policy number, expiry date, current premium if volunteered, years continuously insured, and reason for shopping.
Licence and permit events	Any driver's licence, vehicle permit or similar suspension or cancellation in the last 6 years, with dates and details.
Insurance cancellations	Any insurer cancellation in the last 3 years, including non-payment where asked.
Misrepresentation	Any policy cancellation or claim denial for material misrepresentation in the last 3 years.
Fraud finding	Any court finding of fraud connected with auto insurance.
Accidents and claims	All ownership, use or operation accidents and claims in the last 6 years: driver, vehicle, date, fault percentage if known, coverage, paid or estimated amount and details.
Convictions	All driving convictions in the last 3 years: driver, conviction date and description.

Coverage configuration

Every route must receive the same requested effective date and benchmark coverage package. If a route cannot match it, preserve the quote but mark it non-comparable and list every difference.

Coverage group	Normalization requirement
Policy timing	Requested effective date; 12-month term where available; same quote date window.
Third-party liability	Selected limit, such as \$1 million or \$2 million. Ontario's legal minimum is \$200,000, but the project must use one consistent user-selected limit.
Accident benefits	Mandatory medical, rehabilitation and attendant care; requested increased limits; explicit included or excluded status for every optional benefit after July 1, 2026.

Coverage group	Normalization requirement
Optional benefits to record	Income replacement; non-earner; caregiver; lost educational expenses; expenses of visitors; housekeeping and home maintenance; damage to personal items; death; funeral; dependant care; indexation; supplementary or increased medical, rehabilitation and attendant care; catastrophic impairment.
Uninsured automobile	Included status and limit details where returned.
DCPD	Included or opted out; deductible if any. If the applicant elects OPCF 49, collision and all-perils implications must be surfaced.
Own-damage coverage	Specified perils, comprehensive, collision or all perils; deductible for each.
Endorsements	At minimum track OPCF 20 transportation replacement, OPCF 27 non-owned automobiles, OPCF 43 removing depreciation deduction and OPCF 44R family protection when offered or requested.
Discounts	Bundle, multi-vehicle, winter tires, theft-recovery, driver training, claims-free, conviction-free, retiree, affinity and telematics. Record which discounts are conditional.
Payment	Annual versus monthly premium; finance charge or instalment fee; deposit; number and amount of instalments. Never submit payment.

Ontario changed accident-benefit defaults on July 1, 2026. Only medical, rehabilitation and attendant care remain mandatory for new policies; other accident benefits are optional and must be captured explicitly. [19] [20]

Suggested demo benchmark

APPLES-TO-APPLES For the demo, use one disclosed configuration such as \$2 million third-party liability, DCPD included, standard mandatory medical/rehabilitation/attendant-care benefits, collision and comprehensive with \$1,000 deductibles, OPCF 44R, and no telematics unless separately opted into. This is a comparison benchmark, not coverage advice. Record every optional benefit as included, excluded, unavailable or unknown.

7. Normalize and prove every result

Quote result schema

Result group	Required output
Source identity	Registry ID, brand, legal underwriter, group, intermediary and distinct rate-source ID.
Outcome	Status enum, exact quote versus estimate, eligibility result, failure reason and next action.
Price	Annual premium, monthly amount, down payment, instalment or finance charges, taxes or fees, total estimated cost and currency.
Coverage	All requested limits, deductibles, optional benefits and endorsements, plus any variance from the benchmark.
Discounts	Applied, available but not selected, conditional on purchase, bundle, membership or telematics.

Result group	Required output
Validity	Quote or reference ID, effective date, expiry or guarantee date, and whether verification may change the premium.
Evidence	Timestamp, source URL or public phone route, redacted screenshot or call outcome, and evidence hash or artifact link.
Confidence	High for a returned exact premium with matching coverage; medium for a licensed representative's documented quote; low for an estimate or unresolved coverage difference.
Privacy	Fields disclosed to the route, consent receipt, retention deadline and proof that secrets were excluded from logs.

Status enum

Status	Meaning
quoted_comparable	Exact premium and benchmark coverage matched.
quoted_non_comparable	Exact premium returned, but one or more coverage assumptions differ.
estimate_only	Indicative price, range or lead estimate, not a firm quote.
callback_required	A licensed representative must call before a rate is available.
manual_handoff	Applicant or human operator is required for consent, identity or advice.
ineligible	The profile fails an approved rule or product requirement, with the stated reason.
affinity_restricted	A valid group, employer or membership relationship is required.
specialty_only	The route does not write standard private-passenger use for this profile.
duplicate_rate_source	A different brand or route resolved to the same underlying rate program.
not_currently_writing	Evidence indicates no new applicable Ontario PPA business.
blocked	Terms, CAPTCHA, authentication or another access control prevents automation.
unreachable	A bounded number of attempts produced no response.
unresolved	More research is required; never silently convert this to "not offered."

Coverage metrics

- Market completion = distinct rate sources with evidence-backed terminal status ÷ verified applicable rate sources.
- Comparable quote yield = quoted_comparable results ÷ verified applicable rate sources.
- Evidence rate = outcomes with a valid source, timestamp and redacted artifact ÷ all outcomes.
- Duplicate suppression = brands or routes mapped to an existing distinct_rate_source_id rather than counted twice.
- Freshness = percentage of registry records verified during the hackathon window.

Comparison experience

The user should be able to sort by annual cost, see coverage differences before price differences, filter estimates out, open the evidence for each outcome and understand exactly which markets remain unresolved. Never label the lowest displayed number as “best” without surfacing non-price differences and eligibility conditions.

8. Identity, privacy and safety rules

NON-NEGOTIABLE Use truthful risk information. The current OAF 1 warns against false particulars, misrepresentation and false documents. The regulator also identifies policy misrepresentation and quote manipulation as auto-insurance fraud categories. [2] [21]

Alias and driver's licence rule

- An alias may be used only for discovery or an estimate path that does not verify identity, does not request a declaration that all information is true and permits that use under the site's terms.
- For a live consumer quote, use the participant's own legal name and accurate risk information.
- If any route requests a driver's licence number, use only the participant's own valid Ontario licence number and the legal name exactly matching that licence.
- Never invent, generate, borrow, alter or store another person's driver's licence number.
- If alias mode reaches an identity check, database lookup, consent declaration or application attestation, stop and switch to an explicit human checkpoint. Do not mix an alias with a real licence number.
- If the participant has no licence, do not attempt to work around the field. Stop at that point and preserve the earlier, non-verifying estimate or route-discovery evidence. That is an acceptable challenge outcome.

Consent and other household drivers

- Obtain the participant's explicit consent before sharing any personal data with a quote route.
- Do not enter another household driver's information without that person's consent. The OAF 1 declaration requires the applicant to have obtained listed drivers' consent for collection, use and disclosure of driving, policy and claims history.
- Show the user which route will receive which fields before submission and let the user exclude a route.
- Treat licence numbers, date of birth, address, claims history, voice data and VIN as sensitive data.

Secure implementation

- Keep sensitive fields in a dedicated encrypted vault and inject them only into the destination that needs them.
- Mask licence numbers and other identifiers in the UI; never place them in prompts, traces, analytics, screenshots, demos, source control or submitted datasets. Do not retain raw page captures or call transcripts that include them.
- Redact browser and call evidence before saving or presenting it.
- Use least-privilege access, short retention and a one-click delete function. Delete hackathon quote data after judging unless the participant explicitly chooses otherwise.
- Keep consent receipts, access logs and deletion records separate from the quote display.
- Follow the destination's terms, privacy notice and rate limits. Stop if automated access is not permitted.

Phone and recording safety

Canadian criminal law permits interception with consent from an originator or intended recipient, but privacy obligations and organizational policies can impose additional duties. For this challenge, use the stricter rule: disclose automation, ask for affirmative recording or transcription consent, and do not retain audio if consent is not granted. Automated or unsolicited calling rules may also apply depending on how a system is deployed. Do not treat a hackathon prototype as production-ready telephony compliance. [22] [23] [24]

Legal and professional boundary

The prototype obtains and compares information. It does not sell insurance, bind coverage, provide licensed advice or decide which coverage is suitable. If the experience crosses into advice or purchase, transfer the user to a properly licensed broker, agent or insurer representative.

Personal-use protection

This is a personal-use hackathon prototype, not a commercial product. Do not sell, license, market, publish for public use, or deploy the submission as an insurance-quote service. This boundary is there to protect you: commercializing an automated insurance-quote product without the required permissions can expose you to insurer or provider disputes and litigation, as well as privacy, telemarketing and regulatory risk. Submission conditions, including ownership and commercialization rights, will be presented for affirmative acceptance when you submit.

9. Submission requirements

FORMAT Participation and submission are individual. Ontario residents may participate in person or remotely; in-person attendance is encouraged but not required. Submit through the Organizer's submission form. A shortlisted participant may be asked to run the system live and explain the evidence lineage; a pre-recorded walkthrough or static mock alone does not establish that the system works. Submission is conditional on accepting the linked Submission IP Agreement.

- GitHub repository and setup instructions: provide the repository URL and enough instructions for judges to understand how the system runs. Use a private repository only if the Organizer has been given access.
- Three to five minute Loom walkthrough: show the product, its market-routing logic, one working route to a returned quote or exact terminal blocker, two normalized results and one evidence-backed no-quote or handoff outcome. Use voice, callback or broker-assisted context handoff where the route needs it.
- Machine-readable market registry: submit CSV or JSON with sources, verification dates, channels, statuses and distinct rate-source IDs.
- Redacted run report: include the coverage ledger, comparisons, gaps, errors and timestamps without real licence numbers or other sensitive data.
- Architecture and safety note: explain agent responsibilities, human checkpoints, consent flow, data storage, redaction and deletion.
- Known limitations: state where the system depends on a human, licensed intermediary, membership, terms permission or unavailable integration.

Minimum demo acceptance

Area	Acceptance check
Retrieval	At least one permitted route reaches a returned rate or exact terminal blocker. A browser UI, a specific SDK and visible cursor movement are not required.
Cross-channel	Where the chosen journey requires it, show an outbound or inbound voice, callback, broker-assisted or other permitted handoff that preserves context and discloses automation.
Normalization	At least two outcomes use the common schema and show coverage differences.
Market map	The registry distinguishes legal underwriter, group, brand, distributor and rate source.
Evidence	Every demonstrated outcome has a timestamp and redacted evidence.
Safety	No real licence number, full address, payment data or unredacted call recording appears in the submission; no route uses a fabricated licence number.

Review and finalist process

- All qualifying submissions will receive a high-level review of the submission form, repository, Loom walkthrough and required artifacts.
- The Organizer may invite up to 10 shortlisted participants to a live remote or in-person walkthrough and verification session. A remote shortlisted participant must be able to attend the requested live remote session. A live walkthrough may include a request to run the system, explain evidence lineage and answer questions about limitations and safety controls.
- Optional demos delivered during the event are showcase opportunities only. They do not replace the final submission or determine eligibility by themselves.
- The Organizer will communicate finalist timing, presentation logistics and any follow-up instructions directly to selected participants.

Judging focus

- Creativity and interpretation: does the participant find a clever, useful way through a fragmented market?
- Domain understanding: does the system correctly separate insurers, brands, brokers, programs and coverage differences?
- Technical execution: does the chosen approach work reliably, recover from errors and preserve an audit trail?
- Live proof: can the participant show a real run, evidence lineage and, where relevant, a quote-ID or callback handoff rather than only pre-canned output?
- Coverage and honesty: how much of the verified market is completed, and are gaps reported without inflation or hallucination?
- Privacy and safety: are identity, consent, sensitive data and access controls handled responsibly?
- Communication: can the participant clearly explain what was built, what was quoted and what remains unresolved?

WINNING PRINCIPLE A smaller number of trustworthy, comparable quotes with excellent evidence is stronger than a large number of duplicated, estimated or unverifiable results. The best system makes both its reach and its uncertainty legible.

Appendix A. Regulatory seed list

The following 32 insurer groups and 60 legal entities appeared in the Ontario regulator's public private-passenger rate-approval dataset on August 6, 2026. This is a discovery seed. It does not by itself prove current new-business availability, standard personal-auto scope or a consumer-accessible quote path. Every row requires current validation. [1]

Group	Legal entities in seed dataset	Starting route / validation note
AIG	AIG Insurance Company of Canada	Specialty/commercial broker; validate PPA relevance
Allstate	Allstate Insurance Company of Canada; Esurance Insurance Company of Canada; Pafco Insurance Company; Pembridge Insurance Company	Allstate direct/agent; Pafco and Pembridge broker; validate Esurance
Aviva	Aviva General Insurance Company; Aviva Insurance Company of Canada; S&Y Insurance Company; Scottish & York Insurance Co. Limited; Traders General Insurance Company	Direct, RBC, broker and program routes; deduplicate and validate legacy entities
Beneva	Unica Insurance Inc.	Broker route
CAA	CAA Insurance Company; Echelon Insurance	CAA direct/broker; Echelon broker and non-standard
Chubb	Chubb Insurance Company of Canada	High-net-worth or specialty broker
Co-op	COSECO Insurance Company; CUMIS General Insurance Company; Co-operators General Insurance Company; The Sovereign General Insurance Company	Co-operators web/agent; affinity and specialty entities need validation
Commonwell	The Commonwell Mutual Insurance Group	Mutual and broker/agent route
Continental	Continental Casualty Company	Specialty/commercial broker; validate PPA relevance
Definity	Definity Insurance Company; Sonnet Insurance Company	Definity/Economical broker; Sonnet direct
Desjardins	Certas Direct Insurance Company; Certas Home and Auto Insurance Company; The Personal Insurance Company	Desjardins web/agent; The Personal affinity
Economical	Economical Mutual Insurance Company	Broker route; map current legal entity/program
FA	Facility Association	Residual-market route through licensed intermediary
FMRe	Farm Mutual Reinsurance Plan Inc. (on behalf of Ontario Mutuels)	Ontario Mutuels locator and specific mutual validation
Gore	Gore Mutual Insurance Company	Broker route
Hartford	Hartford Fire Insurance Company	Specialty/commercial broker; validate PPA relevance
Heartland	Heartland Farm Mutual Inc.	Mutual/local agent or broker
Intact	Belair Insurance Company Inc.; The Guarantee Company of North America; Intact Insurance Company; Jevco Insurance Company; Novex Insurance Company; Royal & SunAlliance Insurance Company of Canada; Unifund Assurance Company; Western Assurance Company	belairdirect direct; Intact and Jevco broker; validate legacy/affinity entities
Liberty	Liberty Mutual Insurance Company	Specialty/commercial broker; validate PPA relevance
Northbridge	Federated Insurance Company of Canada; Northbridge General Insurance Corporation; Verassure Insurance Company; Zenith Insurance Company	Northbridge and Zenith broker; validate Federated/Verassure scope
Optimum	Optimum Insurance Company Inc.	Broker route

Group	Legal entities in seed dataset	Starting route / validation note
PURE	PURE Insurance	High-net-worth broker
Peel	Peel Mutual Insurance Company	Mutual/local agent or broker
Portage	The Portage la Prairie Mutual Insurance Company	Broker route
SGL	Coachman Insurance Company; SGL CANADA Insurance Services Ltd.	Broker route; Coachman non-standard
Sompo	Endurance Specialty Insurance Ltd.; Sompo Japan Insurance Inc.	Specialty/commercial broker; validate PPA relevance
TD	Primum Insurance Company; Security National Insurance Company; TD General Insurance Company	TD online, phone and affinity routes
Tokio	Tokio Marine and Nichido Fire Insurance Company Limited	Specialty/commercial broker; validate PPA relevance
Travelers	The Dominion of Canada General Insurance Company	Broker route
Wawanesa	The Wawanesa Mutual Insurance Company	Broker route
XL	XL Specialty Insurance Company	Specialty/commercial broker; validate PPA relevance
Zurich	Zurich Insurance Company	Square One direct for Ontario car; specialty broker routes may differ

Names reflect the regulator's public dataset display. Current legal names, amalgamations, product scope and new-business status must be verified against authoritative sources during the hackathon.

Appendix B. Market-record template

Participants may use the following as a minimum machine-readable record:

Field	Meaning
registry_id	Stable internal key
legal_underwriter	Licensed company name
insurer_group	Parent or operating group
brand_or_program	Consumer-facing route
distribution_type	direct agent broker aggregator affinity MGA_program mutual residual
product_scope	standard_PPA nonstandard_PPA high_net_worth collector commercial_specialty unknown
distinct_rate_source_id	Deduplication key
quote_url	Official public quote URL
public_phone_route	Public sales or callback route
licensed_intermediary	Brokerage or agency name and regulator evidence
requirements	licence VIN membership callback human other

Field	Meaning
automation_notes	Terms, CAPTCHA, rate limit and handoff notes
status	One value from the brief's status enum
source_url	Authoritative evidence
last_verified_at	ISO 8601 timestamp
evidence_artifact	Redacted screenshot, structured call note or response reference

Recommended bounded-attempt policy

- Web: one normal attempt plus one retry for a transient technical error. Do not retry a rejection, CAPTCHA or terms restriction.
- Outbound voice: one call during published sales hours and one retry only if the line fails before connection. Do not repeatedly call representatives.
- Callback: wait through the declared callback window, then mark callback_required or unreachable with the timestamps.
- Broker: ask once for the complete carrier list and all obtained quote outcomes. Preserve the response as evidence.
- Unresolved records remain unresolved. They are not silently dropped from the denominator.

Sources and verification links

Research checked August 6, 2026. Participants should re-verify market relationships and quote paths because panels, legal entities, eligibility and website flows change.

FINAL REMINDER The prototype should help a real person understand the market without pretending that an estimate is a quote, a brand is an insurer, an intermediary covers the whole market, or a failed attempt never happened.
